

Mammary gland cancer treatment by DST preparations

In modern oncology, mammary gland cancer constantly occupies one of the leading places. The treatment is, as a rule, a standard one, without taking into account individual characteristics of women. There is no doubt that oncologists have attained impressive results in treating different kinds of mammary gland cancer. However, in neglected cases and in case of relapse, effectiveness of the existing methods of treatment has a tendency to reach a zero. However deplorable it may seem, it is a well-established fact.

Mammary gland cancer peculiarity consists in quick formation of metastases into vital organs and bones. In this case young women represent a special contingent of women who should be attentively observed by oncologists for many years, even in case the operation had been performed in due time. Those patients who consulted doctors late or simply were afraid of surgical intervention cannot find a way out. Many of them address quacks, wise women or apply strange methods of treatment incompatible with any imaginations, beliefs and teachings. These women apply cabbage leaves, drink urine, kerosene and vodka with oil, wrap beasts with dog's fur. So, everyone is the Jack of all trades... We can and must understand all these sufferers. These actions reflect their life, perturbations, and helplessness. For solving this difficult problem it is necessary to overcome all fears and consult a doctor. In case of unfavorable predictions, two ways are possible. One way consists in not disturbing the tumor and let it go as it goes, or to turn to another way and find an alternative scientific method of treatment. In the first case, normal life is guaranteed for 2-4 years (sometimes even for decades) with some discomfort, but the person should understand that sooner or later everything will end in metastases and... In the second case, tumor growth rate can be stopped and even cure is possible. However, the choice of an alternative treatment method is very difficult and simply dangerous. There are too many wonder-remedies nowadays, they have been offered even by representatives of scientists who make the desired look as a reality. At the end of their life many patients suffering from mammary gland relapse or metastases regret having made a surgery, chemistry, radiation, etc. All 3-5 years which they have lived after that treatment were connected with strong sufferings and emotional torments. There is nobody to console them. Oncologists simply do not look into the eyes and complain that "chemistry" is not working during the last 10-15 years... The question why these

procedures are carried out though it is known that they are ineffective, they answer that "this is a protocol", simply speaking it is a routine. We can understand and forgive them because they as well as cancer patients are themselves the hostages of the situation in oncology for the last decades. There is no doubt that there exist oncologists, both scientists and physicians, who are able to revise their ideas and to cast doubt on the rightness of the way chosen. More and more often there appear physicians who realizing the tragedy of the situation send their patients to alternative methods of treatment which have proved their effectiveness. The number of patients sent to me by oncologists is increasing with every coming day. Even several oncologists themselves after having diagnosed cancer addressed me... In some months and even years, relapses develop sometimes slowly, but sometimes immediately. After the post-operation scar is overgrown by the tumor and metastases develop in liver and bones, life becomes a hell.. And even such life doesn't last long... DST therapy is still not a panacea, but an alternative scientific method of treating many kinds of cancer including mammary gland cancer. Our practice includes wonderful cases of curing, but there are also stories with a sad end. However, even now it is possible to declare with all the awareness that I have fixed the phenomenon lying in the nature of cancer. Not only research, but practical results as well speak for that. In some cases ineffectiveness of DST therapy can be explained very simply. Studies for specific activity, pharmacodynamics, pharmacokinetics, etc. have not been carried out sufficiently. There is no doubt that in case we used local, intracavitary, intravenous and intramuscular injection of preparations, the results of treatment would be much, much better. This is certified by the fact that with treatment of those cancer forms when DST preparation directly contacts the tumor in the process of treatment, the process of recovery is going on much faster that with tumors which do not have a direct contact with DST preparations. It has been noted hat such difficult forms of cancer as stomach cancer and lung cancer react to DST therapy rather quickly. Inhalations with lung cancer and beverages with stomach cancer deliver the preparation directly to the tumor. The same relates to tongue cancer, rectum and sigmoid colon cancer and partially to mammary gland cancer, etc. DST preparations are absolutely safe and non-toxic substances. This has been certified by treating hundreds of patients during 17 years. Everything is stopped by an ethical problem - there is no official permission.

The results and stages of treating patients-volunteers (!) who refused official medical treatment due to different reasons and weren't caught by charlatans are given below. It looks a little frightening, but the results are worth looking at. In this case metastases never(!) occur. Outside look and discomfort during a year or a little more are more than compensated. None of the patients complained of having pains or any other unpleasant feelings. There is complete analgesia. As a rule, after a year and a half or two years the patient forgets about the cancer forever. The illness is reminded by an uneven scar and longing for the disappeared mammary gland. However, in future the process of mummification should be replaced by a small dystrophy or mammary gland deformation. Then reconstruction plastics or prosthetics can be carried out. I remind again that this article is not an advertisement and doesn't guarantee 100 % recovery. Each person should decide what to do in his/her case. This article doesn't advertise some wonder-cure, this is an attempt to divert some indecisive patients from any possible kinds of charlatanism. As Tibetan medicine says "There are no wonder-cures in the world. They either make someone rich, or cherish hopes".

The following, to my opinion, a rather shocking fact has been reliably stated. In case a malignant tumor is not treated at all, but only observed, at a definite moment it can switch to retrograde development. However, I don't call for passive observation especially if the tumor is situated inside the organism. As a rule, the tumor tries to "live" only in a definite organ. Depending on its aggressiveness, it can feed on this organ or live in peace with it for a long time. All this seems rather scary, but in this case there are practically no metastases. The main aim is to make the tumor degrade or "fall asleep" for many years. As a rule, there are several stages of cancer genesis. Having discovered a tumor, all people go to oncologists. Biopsy puncture is prescribed immediately. This is the most "dangerous" part in the disease history case. This manipulation and sectional excision of the tumor become a guaranteed method of "scattering" metastases, thrombogenic and malignant materials. After biopsy, surgery or radiation, or chemotherapy are prescribed as a rule. Then, according to the list... There is no doubt that there exists a number of tumors with high malignancy which necessitate rapid surgery and aggressive chemotherapy. However, on the average, all cancers are highly malignant, and the patient has time to take decision by himself what kind of treatment to choose.

This is how "passive" pathogenesis of "external cancer" looks like and its treatment by means of DST therapy. This very patient had underarm lymph nodes struck as well as 3 big metastases in liver/ That's why she refused from surgery and chemotherapy. At the start of the treatment (in case we start treatment in the 3-4 stage) gland edema, hyperemia, and small discharge from the nipple.

Then fistulas appear and edema starts to fall. Then demarcation between healthy and cancerous tissues occurs. You should pay attention to a tumor which goes along the ribs. It will disappear afterwards. The skin starts, so to say, "boiling", but there is no temperature rise at that moment. Mammary gland tissues are also cool.

Stages of mammary gland cancer treatment by means of DST therapy.

Edema disappear completely and a process somewhat like necrosis, or better mummification, starts. After some "hesitation" blastoma starts to dry down, but at the same time protozoa and bacteria of all kinds populate all its surface and the gland thickness. I draw your attention to the "tumor". According to all parameters it should increase in size due to seeding. Though this doesn't occur. Metastases and reactive pleuritis do not occur as well, though they should take place according to the logics. At one moment sharp decrease of the gland volume occurs. It seems to "fall down" and demarcation line becomes more pronounced. Demarcation lines along the breast-bone and under the mummified breast are straight which also shows the existence of "geometry" in the organism. Edema disappears completely, and the process simultaneously looking like necrosis and mummification continues. Everything points to tumor reinvolution. In relation to the center, there remain round the tumor remnants: maceration, pigment spots and scaling. Due to tumor mummification all the population: commercials, saprophytes and parasites are not able to help the tumor progress. Later, only a scar and a small portion of healthy tissue remains oat the place of the mammary gland. I would like to remind you that no metastasis and relapses are observed with this kind of treatment. Here are similar examples.

Patient D., 65 years old

Patient 3., 45 years old

Patient T. - 47 years old.

Patient K. - 34 years old

I would like to draw your attention to the fact that if a patient addresses the doctor during the 1st or 2nd stage, then treatment is more effective and there is no mummification. In case of the 3rd and 4th stages and after chemotherapy, the mummification process is much more difficult and takes more time.

a) before treatment

b) 3 months after the start of treatment

The first stages described above are absent at lower photographs.

Final stages in treating mammary gland blastoma. Scar and complete absence of metastases. Observation of the patients during 14 years unanimously shows the possibility of applying this method for treating mammary gland cancer. I do not ask everyone to use this method, but if you are afraid and cannot decide about surgery or chemotherapy, then this method is for you. It is very difficult for women (especially young) to see an even, "beautiful" scar in the place of the former mammary gland the next day after the surgery... The process which will be going during a year with gradual disappearance or deformation of the gland is psychologically less traumatic. Slow parting with your organ is taking place with simultaneous growth of hope on the possibility of plastic operation.. What is the most important with such kind of treatment is that the threat for life due to metastases and relapses practically disappears. Long and happy life with a curving scar is much better that tormented death due to metastases and relapses. This is an axiom that doesn't need to be proved. This treatment is ambulatory, or, simply speaking, at home. This treatment doesn't take people out of their routine life, all patients are working and feel absolutely healthy. Their analyses are the subject of envy. Thus, mammary gland cancer treatment from the point of view of alternative scientific oncology can be presented in such an unusual way. The only condition is the most important postulate of medicine : Don't harm the patient! In the given case this postulate is preserved in its initial form.

Doctor M. V. Kutushov
